Sequences and Series

Satvik Saha

Problem Calculate the given sum, to n terms

$$S_n = 1(0!) + 3(1!) + 7(2!) + 13(3!) + 21(4!) + \cdots + T_{n-1}$$

where T_k is the k^{th} term of the given series.

Solution Observe

$$T_k = (k^2 + k + 1) \cdot k!$$

Consider the definition

$$F_k = k \cdot k!$$

Note that $n! = n \cdot (n-1)!$

$$\begin{aligned} F_{k+1} &= (k+1) \cdot (k+1)! \\ &= (k+1) \cdot (k+1) \cdot k! \\ &= (k^2 + 2k + 1) \cdot k! \\ &= (k^2 + k + 1) \cdot k! + k \cdot k! \\ &= T_k + F_k \\ \boxed{T_k} &\boxed{= F_{k+1} - F_k} \end{aligned}$$

The required sum S_n is thus is given by

$$\begin{aligned} S_n &= \sum_{k=0}^{n-1} T_k \\ &= \sum_{k=0}^{n-1} F_{k+1} - \sum_{k=0}^{n-1} F_k \\ &= \sum_{k=1}^{n} F_k - \sum_{k=0}^{n-1} F_k \\ &= F_n - F_0 \\ &= n \cdot n! - 0 \cdot 0! \end{aligned}$$

$$\boxed{S_n = n \cdot n!}$$

Hence, it is obvious that $S_{4000} = 4000 \cdot 4000!$
